

Streamlining IT Procurement: Automating Standard Laptop Orders with Flow Designer

Project Design Phase-II: Solution Requirements (Functional & Non-functional)

Date:	October 3, 2026	Maximum Marks:	4 Marks
Team ID:	SWTID-2026-2585	Project Name:	Standard Laptop Automation

Functional Requirements:

Following are the functional requirements of the proposed solution.

FR No.	Functional Requirement (Epic)	Sub Requirement (Story / Sub-Task)
FR-1	Service Catalog	Employee / Requester can access the Standard Laptop catalog item under Service Catalog → Hardware (USN-1) Employee / Requester can submit the request using Order Now, which creates a Request (REQ) and a Requested Item (RITM) (USN-2)
FR-2	Approval Process	Standard Laptop request reaches the approval stage and appears in the Approvers section of the Request (USN-3) Approver can approve the request so that the Requested Item holds the required approval record
FR-3	Service Catalog Configuration	Configure the Standard Laptop item in Maintain Items → Process Engine to use the “Standard laptop task” flow (USN-4) Remove other automations (workflow / execution plan) so that only the Flow is selected
FR-4	Flow Designer Automation	Create the flow “Standard laptop task” in Flow Designer with application scope Global (USN-5) Run the flow as System User Use Service Catalog as the flow trigger, then activate the flow
FR-5	Catalog Task Creation	Automatically create a Catalog Task [sc_task] from the Requested Item using the Create Catalog Task action (USN-6) Set Short Description and Description to “Laptop need to Configured” and Approval to “Approved”
FR-6	Task Assignment	Automatically set the Assignment group of the generated Catalog Task to Hardware (USN-7)

FR-7	Task Configuration (Hardware Team)	Hardware team member can view the generated Catalog Task with the required configuration information (USN-8) Task is visible in the Catalog Tasks section of the Requested Item
FR-8	Validation & Testing	Validate the complete workflow from laptop request through approval to Hardware task creation (USN-9) Confirm that an approved request creates the correct Catalog Task and assigns it to Hardware

Non-functional Requirements:

Following are the non-functional requirements of the proposed solution.

FR No.	Non-Functional Requirement	Description
NFR-1	Usability	Requesters order the laptop with a simple catalog path (Service Catalog → Hardware → Standard Laptop → Order Now) and can track the Request number and order status. The Hardware team sees a clear task ("Laptop need to Configured") with no manual task creation.
NFR-2	Security	Access is controlled by ServiceNow login and role-based access, and the task is created only for requests going through the approval process. The flow runs as System User in Global scope, and the Request, Requested Item and Catalog Task records are accessible only to authorised users and groups.
NFR-3	Reliability	The flow is triggered automatically by the Service Catalog, so every Standard Laptop request gets a Catalog Task without being missed or forgotten. Flow Designer execution records allow failed or incomplete runs to be reviewed.
NFR-4	Performance	The Catalog Task is generated automatically by an event-driven flow, avoiding manual hand-offs and waiting time. Each request is handled independently and the task appears in the Hardware assignment group queue shortly after the flow runs.
NFR-5	Availability	The solution runs on the ServiceNow cloud platform, so requesters, approvers and the Hardware team can use it from a web browser whenever the ServiceNow instance is available.
NFR-6	Scalability	The same flow handles any number of Standard Laptop requests, since a Catalog Task is created for each Requested Item. The flow can be reused or extended to other catalog items and assignment groups through Flow Designer configuration.
