

Streamlining IT Procurement: Automating Standard Laptop Orders with Flow Designer

PERFORMANCE TESTING Standard Laptop Procurement Automation

ServiceNow Flow Designer

Date:	October 03,2026	Maximum Marks:	
Team ID:	SWTID-2026-2585	Project Name:	Standard Laptop Automation

1. Test Overview

Project Name:	Streamlining IT Procurement – Automating Standard Laptop Orders with Flow Designer	Test Type:	Functional performance / workflow execution observation
Application:	ServiceNow	Test Date:	October 03,2026

This performance-testing document evaluates the observed execution of the Standard Laptop procurement automation. The objective is to verify that the configured ServiceNow workflow completes the intended processing path from an approved Standard Laptop request to automatic Catalog Task creation and Hardware assignment.

2. Testing Scope

- Standard Laptop Catalog Item request submission
- Approval processing
- Execution of the Standard Laptop Task Flow Designer flow
- Automatic Catalog Task creation
- Catalog Task description population
- Assignment of the Catalog Task to the Hardware assignment group
- End-to-end workflow completion

3. Test Environment

Platform: ServiceNow instance used for the project

Feature: Service Catalog + Flow Designer

Catalog Item: Standard Laptop

Flow: Standard Laptop Task

Assignment Group: Hardware

No credentials are recorded in this document.

4. Performance / Execution Test Cases

Test ID	Scenario	Execution	Expected Observation	Observed Result	Status
PT-001	Standard Laptop request submission	Submit a Standard Laptop request through Service Catalog.	Request should be accepted and become available for approval.	Request was successfully placed during the documented project procedure.	PASS
PT-002	Approval-to-flow execution	Approve the Standard Laptop request.	The configured approval condition should allow the automation to process the Approved Requested item.	Approval was completed and the Requested Item was opened for verification.	PASS
PT-003	Automatic Catalog Task creation	Inspect the approved Requested Item after flow execution	A Catalog Task should be automatically created.	A Catalog Task was created automatically under the Requested Item.	PASS

PT-004	Catalog Task assignment	Open the generated Catalog Task and inspect Assignment Group	Assignment Group should be Hardware.	The generated task was verified as assigned to Hardware.	PASS
PT-005	Catalog Task description	Inspect the generated task description .	Configured task description should be populated.	The task description was verified as 'Laptop needs to Configured'.	PASS
PT-006	Measured response-time benchmark	Measure elapsed time for request approval to task creation using a consistent timing method.	A measured response time should be recorded for benchmarking.	No controlled timing measurement was captured in the existing implementation evidence.	NOT MEASURED

5. Performance Observations

- The configured flow completed the intended automation path in the recorded implementation.
- The automation removed the need for manual creation of the Catalog Task after approval.
- The Catalog Task was generated with the configured description and Hardware assignment group.
- The available evidence demonstrates functional workflow execution, but it does not provide controlled response-time, throughput, concurrency, or load-test measurements.

6. Performance Metrics

Metric	Result	Evidence / Note
Workflow completion	Successful	End-to-end execution was verified in the implementation procedure.
Catalog Task creation	Successful	Catalog Task appeared under the approved Requested item.
Hardware assignment	Successful	Assignment Group verified as Hardware.
Response time	Not measured	No controlled timing data was captured.
Throughput	Not measured	No load/concurrency test was performed.
users Concurrent	Not measured	No concurrency test was performed.

7. Test Result

The recorded implementation successfully demonstrated the intended functional execution of the Standard Laptop procurement automation. After approval, the workflow produced a Catalog Task and assigned it to the Hardware group. Quantitative performance benchmarks such as response time, throughput, and concurrent-user capacity were not measured in the available project evidence and therefore are not reported as measured results.

8. Evidence to Attach

- Flow Designer – Standard Laptop Task configuration screenshot
- Standard Laptop Catalog Item – Process Engine / flow association screenshot
- Standard Laptop order screenshot
- Approval screenshot
- Requested Item – Catalog Tasks screenshot
- Generated Catalog Task showing description and Hardware assignment group
- Demo video link

9. Conclusion

Based on the available execution evidence, the Standard Laptop procurement automation completed its intended workflow and produced the expected Catalog Task assignment outcome. Additional quantitative load or response-time benchmarking would require a controlled test run with timing and concurrency measurements.
